

Prof. Rafael Vicuña Professor

Most important awards, prizes and academies

Honours: Fulbright Foundation, travel fellowship (1974, 1978); Albert Einstein College of Medicine, NY, fellowship for Ph.D. studies (1974-78); International Union of Biochemistry, travel fellowship (1979); John Simon Guggenheim Memorial Foundation fellowship (1986); officially invited by the Chinese Government (mainland) to visit academic institutions (1989) and by the DFG to visit academic institutions in Germany (1998). *Academies:* Chilean Society of Biology (1973); Chilean Society of Biochemistry and Molecular Biology (1973, President 1997-99); American Society for Microbiology (1974); Association for Politics and the Life Sciences, USA (1987); Technical Association of the Pulp and Paper Industry, TAPPI, USA (1988-2000); Third World Academy of Sciences (1993); Chilean Society of Microbiology (1996); International Academy of Wood Science (1996); Latin American Academy of Sciences (1999); Chilean Academy of Sciences (1999, Vice-President 2001-03); Pontifical Academy of Sciences (2000).

Summary of scientific research

Major accomplishments in the field of biochemistry of nucleic acids: the identification and characterization of two protein factors that selectively inhibit viral DNA from fX174 phage from using the replication machinery of other single stranded DNA phages; the isolation and thorough characterization of plasmids and the restriction-modification system of the extremely thermophilic

bacterium *Thermus thermophilus*; the purification and characterization of DNA polymerase from *T. thermophilus*, an enzyme that is widely used today in PCR experiments. On the other hand, some achievements in the field of microbial degradation of lignin are: the isolation, identification and characterization of natural bacterial strains able to metabolize lignin model compounds; the elucidation of metabolic pathways involving novel catabolic intermediates; the discovery of the new enzyme benzaldehyde lyase, a proposition for its reaction mechanism and cloning and sequencing of the corresponding gene; finding that the ligninolytic system of the basidiomycete *Ceriporiopsis subvermispora* is composed of a manganese-dependent peroxidase and the copper containing phenol oxidase called laccase. Discovery of a new family of multicopper oxidases in the fungus *Phanerochaete chrysosporium*. Discovery of a transcription factor responding to copper in the same fungus. Proposition of a novel mechanism for the production of the extracellular hydrogen peroxide required as a substrate by MnP in cultures of *C. subvermispora*. Co-director of the genome project of the same fungus. Current work deals with microbial life in extremely arid environments.
